DATE MAILED: 06/22/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>	
	10/661,040	LIANG ET AL.	
	<b>Examiner</b>	<b>Art Unit</b>	
	Stefan Staicovici	1732	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 07 April 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-19 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-19 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### *Response to Amendment*

1. Applicants' amendment filed April 7, 2006 has been entered. Claims 1-19 are pending in the instant application.

### *Claim Rejections - 35 USC § 103*

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Freeman (US Patent No. 4,863,771) in view of Robin *et al.* (US Patent No. 3,892,831) and in further view of Azzani *et al.* (US Patent No. 5,013,514).

Freeman ('771) teaches the basic claimed process for making a tubular composite door including, providing a mold having a lower mold half (24) and an upper mold half (36), placing fiber material (38) onto said lower and upper mold halves, placing an inflatable plastic bladder (40) (plastic tube) onto said fiber material (38), closing said lower and upper mold halves, pressurizing said inflatable plastic bladder (40) (plastic tube) to force said fiber material (38) against said lower and upper mold halves, injecting resin material into said mold to impregnate said fiber material (38) and curing said resin under conditions of pressure and temperature to form said tubular composite door (see col. 2, lines 31 through col. 3, line 10). Further, Freeman

(‘771) teaches forming said inflatable plastic bladder (40) (plastic tube) from a plurality of bladders (plastic tubes) when making a jointed structure (10) (see Figure 1) or forming a single, complex shaped inflatable plastic bladder (see col. 3, lines 20-30).

Regarding claims 1 and 8, although Freeman (‘771) teaches an inflatable plastic bladder (40), Freeman (‘771) does not teach that said plastic is nylon. However, the use of nylon to make an inflatable bladder is well known as evidenced by Robin *et al.* (‘831) who teach a molding process including, providing a mold, placing resin pre-impregnated fiber material around an inflatable, nylon sheath (4) to form a wrapped assembly, placing said wrapped assembly in said mold, inflating said sheath to press said fiber material against said mold and curing said resin (see Abstract, col. 3, lines 40-55 and Figure 1-4) in said mold to form a fiber composite structure. Therefore, it would have been obvious for one of ordinary skill in the art to have provided an inflatable nylon bladder as taught by Robin *et al.* (‘831) in the process of Freeman (‘771) because, Robin *et al.* (‘831) teach that nylon is an optimum material for such a bladder, hence teaching that it is a known material for such applications and also because it is known that nylon is easily stretchable and has resistance to heat during the curing step, hence providing for an improved process by reducing waste. Further regarding claims 1 and 8, Freeman (‘771) does not teach pre-impregnated fiber material. However, it is known that resin injection and pre-impregnation are well known equivalent alternatives as evidenced by Robin *et al.* (‘831) who teach a molding process including, providing a mold, placing fiber material around an inflatable, nylon sheath (4) to form a wrapped assembly, placing said wrapped assembly in said mold, inflating said sheath to press said fiber material against said mold and curing said resin that was

either injected or pre-impregnated (see Abstract, col. 3, lines 40-55 and Figure 1-4) in said mold to form a fiber composite structure. Therefore, it would have been obvious for one of ordinary skill in the art to have used a resin pre-impregnation step as an equivalent alternative to a resin injection step as taught by Robin *et al.* ('831) in the process of Freeman ('771) because, Robin *et al.* ('831) specifically teach that resin injection and resin pre-impregnation are well known equivalent alternatives for applying a resin material to a fiber material in order to mold a fiber composite structure.

Further regarding claims 1 and 8, Freeman ('771) in view of Robin *et al.* ('831) do not each an external vacuum bag. Azzani *et al.* ('514) teach a molding process including, providing a mold (11, 12), placing fiber material around an inflatable bag to form a wrapped assembly, placing said wrapped assembly in said mold, wrapping said mold in an external vacuum bag and sealing said external bag against said inflatable bag, drawing a vacuum onto said external vacuum bag, placing said vacuum, wrapped mold in an autoclave, inflating said inflatable bag using the pressure of the autoclave to force said fiber material against said mold and curing said resin to form a fiber composite structure (see col. 4, line 47 through col. 5, line 5; col. 5, line 63 through col. 6, line 20 and Figure 16). Therefore, it would have been obvious for one of ordinary skill in the art to have used sealed an external vacuum against an internal inflatable bladder as taught by Azzani *et al.* ('514) in the process of Freeman ('771) in view of Robin *et al.* ('831) because of known advantages that a vacuum provides such as reduced porosity and improved mechanical characteristics, hence providing for an improved product.

Further regarding claim 8, Freeman ('771) in view of Robin *et al.* ('831) and in further view of Azzani *et al.* ('514) do not teach trimming the molded composite structure. However, trimming of a molded structure is well known. It would have been obvious for one of ordinary skill in the art to have trimmed the molded composite structure obtained by the process of Freeman ('771) in view of Robin *et al.* ('831) and in further view of Azzani *et al.* ('514) because of known advantages such as improved aesthetics and reduced costs by reducing the complexity of mold design and allowing for some scrap to form.

Regarding claims 2 and 12, Freeman ('771) teaches a glass fiber preform and a thermosetting resin (see col. 2, line 21 and col. 3, lines 1-5). It is noted that it is well known that epoxy is a thermosetting resin used in making fiber reinforced composite structures as evidenced by Robin *et al.* ('831) who teaches an epoxy resin (see col. 3, lines 50-55). Therefore, it would have been obvious for one of ordinary skill in the art to have used an epoxy resin as taught by Robin *et al.* ('831) as the thermosetting resin in the process of Freeman ('771) in view of Azzani *et al.* ('514) because of known advantages that epoxy provides such as increased chemical and mechanical characteristics, ease of processability, its well known status as a thermosetting resin used in making fiber reinforced composite structures and also because, Freeman ('771) teaches a thermosetting resin, hence suggesting an epoxy resin.

In regard to claims 11 and 19, Freeman ('771) teaches pressurizing said inflatable plastic bladder (40) (plastic tube) to force said fiber material (38) against said lower and upper mold halves and maintaining pressure during the curing process (see col. 3, lines 1-10). Further, it is noted that pressure must be maintained during the curing process in order to avoid pore

formation, hence in order for the invention of Freeman ('771) in view of Robin *et al.* ('831) and in further view of Azzani *et al.* ('514) to function as described.

Specifically regarding claims 3-7, 9-10 and 13-18, Freeman ('771) in view of Robin *et al.* ('831) and in further view of Azzani *et al.* ('514) do not teach a specific molding temperature, molding time, vacuum pressure and curing pressure. However, it is submitted that such parameters are result-effective variables that depend on the chosen resin as taught by Freeman ('771) (see col. 3, lines 1-10). Hence, it would have been obvious for one of ordinary skill in the art to have used routine experimentation in the process of Freeman ('771) in view of Robin *et al.* ('831) and in further view of Azzani *et al.* ('514) to determine optimum values of the molding temperature, molding time, vacuum pressure and curing pressure because it is known that such parameters are result-effective variables that depend on the type of resin being used. It is noted that Azzani *et al.* ('514) teach a molding temperature of 80-200 °C, a molding pressure of 3 bars and a molding time varying from several minutes to several hours (see col. 6, lines 25-35).

#### ***Response to Arguments***

4. Applicants' remarks filed April 7, 2006 have been considered.
5. In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

6. Applicants argue that the applied prior art does not teach or suggest “laying up a plurality of composite fabric within a mold and compacting each layer by applying vacuum.” (see pages 10-11 of the amendment filed 4/7/2006). In response, it is noted that Freeman (‘771) specifically teaches applying fibrous material “manually” (see col. 2, lines 23-26). It is submitted that when a fiber composite ply is placed manually into a mold the ply is also compacted. This occurs because of the nature of the hand lay-up procedure in which each ply is compacted by the operator as the ply is positioned in the mold and also by each subsequent ply being applied.

7. Applicants argue that the applied prior art does not teach or suggest “having nylon tubes extending out at each corner of the mold” (see page 11 of the amendment filed 4/7/2006). In response, it is noted that Freeman (‘771) specifically teaches the ability to remove the inflatable plastic bladder (40) (plastic tube) from the resulting molded structure (see col. 3, lines 6-10). Further, it is noted that the bladder of Freeman (‘771) is a flexible bladder occupying hollow space (22), hence it is submitted that it is stretchable. Therefore, it is submitted that the bladder is removed by being pulled out of the hollow area (22) extending through the structure (10) (see col. 2, lines 15-16) and as such access is required in order to pull and remove the bladder as taught by Freeman (‘771). Therefore, in order for such access to be present in the process of Freeman (‘771) in view of Robin *et al.* (‘831) and in further view of Azzani *et al.* (‘514), it is submitted that the bladder extends “out of each corner of the mold” as recited by the instant claimed invention.

8. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

#### ***Conclusion***

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Stefan Staicovici, Ph.D. whose telephone number is (571) 272-1208. The examiner can normally be reached on Monday-Friday 9:30 AM to 6:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Christina Johnson, can be reached on (571) 272-1176. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications
